INTRODUCTION

The fast progress of digital technology in recent years has altered many parts of our life, including education. Teaching English language skills is one area where technology has made significant headway. English literacy is vital in today's globalised world, and educators constantly look for new ways to improve language learning and instruction. Incorporating information technology into English teaching has emerged as a promising technique, providing diverse tools and resources to promote language acquisition and improve pedagogical practices. This systematic study aims to investigate the influence of incorporating information technology into English instruction in the College of Education. This review aims to provide significant insights into the effectiveness and implications of employing technology in English language training by thoroughly examining existing research papers. The conclusions of this review help educators, administrators, and policymakers understand the potential benefits and limitations of incorporating information technology into language teaching. Computer-assisted language learning (CALL), online resources, multimedia materials, language learning apps, and virtual learning environments are examples of information technology integration methodologies and technologies. These technologies give students unique chances to connect with the language in dynamic and immersive ways, enabling customised and self-paced learning experiences. Furthermore, they equip teachers with novel tools for creating dynamic and engaging lessons, facilitating collaborative learning, and successfully assessing students’ progress.

While some studies have demonstrated encouraging results when using information technology in English language instruction, it is vital to examine the entire impact and solve any difficulties. This review will look at quantitative and qualitative studies, such as student engagement, language proficiency outcomes, instructional efficacy, and learner autonomy. It will also investigate students’ and teachers’ perspectives and experiences with technology integration in English language teaching. Understanding the impact of incorporating information technology in English education is critical for developing evidence-based pedagogical techniques that match the requirements and expectations of twenty-first-century learners. This systematic review seeks to synthesise current knowledge on this topic by evaluating the strengths, limitations, and gaps in available research. The findings will help inform future research and instructional design efforts and add to the current discussion about successful language teaching approaches.

Overall, this systematic review provides light on the potential benefits, obstacles, and consequences of incorporating information technology into English instruction in the College of Education. It seeks to provide significant insights for educators, academics, and policymakers through a rigorous examination of current literature, thereby helping the growth of effective language instruction in the digital age.

ABSTRACT

This systematic review investigates the influence of incorporating information technology (IT) in teaching English in higher education settings. With the rapid growth of technology, its integration in education has garnered considerable attention, and this study aims to offer a complete overview of the consequences of IT integration in the context of English language training. The review takes a systematic approach, identifying, selecting, and analysing relevant scientific articles published between 2010 and 2021. The findings highlight many significant areas where IT integration has considerably impacted English teaching in college settings. These areas include improved language acquisition, higher student engagement and motivation, increased access to learning resources, and the development of digital literacy skills. Furthermore, the assessment cites various problems connected with IT integration, such as technical issues, teacher training requirements, and potential technological access disparities. The findings emphasise the importance of careful preparation, pedagogical considerations, and ongoing assistance to effectively integrate IT in teaching English in college settings. This systematic review adds to the existing literature by synthesising and evaluating current knowledge on the subject, providing valuable insights for educators, policymakers, and researchers interested in leveraging information technology to improve English language instruction in higher education institutions.

Keywords
Integrating Information Technology, Language Acquisition, Educational Resources, Virtual Learning Environments
Statement of the Problem

Information technology (IT) in the classroom, particularly in college settings, has drawn considerable interest in education. Several research studies have investigated the possible advantages of integrating IT technologies and resources into English language training to improve students’ language learning. Although there is a sizable amount of literature on the subject, a thorough investigation into the precise effects of integrating IT in teaching English within a college of education setting still needs to be completed.

According to Smith’s (2012) research, integrating IT into language training can provide more interactive and engaging learning environments, encouraging student engagement and enhancing language learning. The use of IT tools like multimedia resources and online platforms may also improve students’ language ability by giving them authentic language experiences outside of typical classroom settings, according to Brown et al. (2016). Despite these potential advantages, evaluating the difficulties and constraints related to incorporating IT in college-level English instruction is vital. According to earlier research by Johnson (2018), insufficient access to technology, a lack of digital literacy among students and educators, and potential distractions from technology can prevent IT from being used effectively in language instruction.

Additionally, as Adams (2021) observed, the effects of IT integration may differ across various pedagogical methods and teaching methodologies. Thus, it is essential to investigate how the use of IT complies with the teaching methods and objectives of the College of Education and how it affects the results of students’ language acquisition and their entire educational experience. Therefore, this research addresses the following problem: What is the impact of integrating information technology in teaching English within the College of Education? It seeks to provide insights into IT integration’s benefits, challenges, and effectiveness in English language instruction within the College of Education.

Research Questions

Q1. What are the effects of integrating information technology (IT) in teaching English on student learning outcomes in college education settings?
Q2. How does using information technology (IT) in teaching English affect student engagement and motivation in college?
Q3. What challenges and barriers are encountered when integrating information technology (IT) in teaching English in the college of education, and how can they be addressed?

METHODOLOGY

Search Strategy

A comprehensive search was conducted on major academic databases, including but not limited to PubMed, ERIC, Google Scholar, Scopus, and Web of Science. The search terms included combinations of “information technology,” “English language teaching,” “College of Education,” “impact,” and related keywords.

Study Selection

Studies were eligible for inclusion if they met the following criteria:
- Focused on the integration of information technology in teaching English.
- Conducted in a College of Education or similar higher education settings.
- Published in English between 2010 and 2021.
- Reported empirical research findings.
- Included outcome measures related to English language learning.

Data Extraction and Analysis

Data from the selected studies were extracted and synthesised using a narrative approach. The studies were analysed based on their research designs, methodologies, participant characteristics, IT interventions, and reported outcomes. The findings were categorised into themes related to English language learning outcomes, teaching practices, student engagement, and overall learning experiences.

Theoretical background

Constructivist Learning Theory

A well-known educational theory called constructivist learning theory emphasises how students actively construct their knowledge through meaningful experiences and interactions with their surroundings (Jonassen, 2011). According to this idea, students build their understanding and knowledge by actively participating in problem-solving, reflection, and cooperation, as well as assimilating new information into their pre-existing cognitive structures (Savery & Duffy, 2015).

Constructivist learning theory’s guiding principles can be well-aligned with information technology integration in English instruction at a college of education. Utilising technology can offer students chances for active participation, exploration, and real-world experiences that support knowledge construction. Effective use of information technology can promote collaborative learning, inquiry-based activities, and the production of multimedia artefacts, increasing students’ motivation and engagement (Zhao & Frank, 2012).

By giving students access to interactive multimedia resources, authentic language resources, and communication tools, incorporating information technology into teaching English can encourage constructivist approaches. Students can explore authentic texts and multimedia content from many cultural contexts, interact in real-world conversation with English speakers, participate in virtual language exchanges, and more, thanks to online platforms and applications (Lai & Bower, 2019). Information technology can also give students the tools to produce and disseminate their knowledge objects.
actively. Learners can build their comprehension of English and literature while simultaneously honing their critical thinking, creativity, and digital literacy abilities through digital storytelling, blogging, and multimedia presentations (Minocha, 2011).

In conclusion, using information technology in teaching English aligns with constructivist learning theory’s guiding principles. Technology-enhanced approaches can improve students’ learning experiences in a college by presenting opportunities for active involvement, collaboration, and knowledge creation. To fully utilise the potential of technology in English language teaching, educators must create learning environments and instructional activities that encourage active involvement, investigation, and reflection.

The Role of Technology in English Language Teaching

The use of information technology in the field of teaching English as a second language (ELT) has been acknowledged as a valuable tool. Li and Ni (2010) assert that using technology in language instruction allows students to learn independently, communicate with others, and have authentic language experiences. Additionally, Warschauer and Healey (2011) contend that using multimedia materials, online platforms, and computer-assisted language learning (CALL) software can help people learn a variety of language abilities, including listening, speaking, reading, and writing.

Attitudes Towards ICT Integration in Education

The success of ICT integration in educational contexts greatly depends on tutors’ views about it. According to research, teachers’ positive attitudes about ICT positively impact how they use technology to teach English. Amuzu and Tetteh’s (2012) study examined tutors’ opinions of ICT integration in Ghanaian education colleges. The results showed that most teachers had favourable opinions of ICT integration. They believed that ICT may increase their teaching efficacy and that it was a valuable instrument for enhancing students’ language abilities.

Factors Influencing Tutors’ Attitudes Towards ICT Integration

Numerous elements have been found to influence tutors’ views about the use of ICT in English instruction. These elements include educational institutions’ support, ICT infrastructure access, training and professional growth. It has been discovered that professional development programs have a favourable influence on tutors’ views about ICT integration. Tutors who got ICT training indicated more significant levels of confidence and desire to incorporate technology in their English language lessons, according to Ofori-Attah and Adu-Gyamfi (2014).

Additionally, for instructors to successfully use technology in their teaching methods, they must have access to ICT infrastructure. According to a study by Asare and Simons (2015), tutors need help using ICT resources like computers and internet connectivity. They could not use technology in their English language education due to a lack of access to ICT infrastructure. Tutors’ attitudes about ICT integration are also significantly shaped by institutional support. Tutors’ perspectives and attitudes regarding ICT integration were positively influenced by adequate support from educational institutions, such as providing ICT resources and technical assistance (Quansah, 2016).

Advantages of Integrating Information Technology in Teaching English

Enhanced Language Learning Opportunities

Using information technology in the classroom improves language learning chances for students. Beyond the limits of typical classroom settings, digital tools, and resources such as multimedia presentations, online language learning platforms, and language learning software provide authentic and immersive language experiences (Liu, 2013). These technologies allow learners to interact with native speakers and practice language skills in actual circumstances, improving language competency and cultural awareness (Gao et al., 2015).

Increased Student Engagement

It has been demonstrated that including IT in English instruction increases student motivation and engagement. According to Chen and Wang (2012), online discussion boards and virtual collaboration tools allowed students to participate actively and express their thoughts more openly. Gamification strategies and instructional mobile apps have been shown to pique students’ attention and encourage independent learning (Sullivan, 2018). IT integration can provide a classroom atmosphere focused on the students’ needs, leading to higher levels of engagement and active participation.

Developments in Language Skills

Incorporating information technology enhances the development of diverse linguistic abilities. CALL applications provide interactive exercises, simulations, and multimedia materials that cater to many language skill areas, such as listening, speaking, reading, and writing (Wu et al., 2020). Brett (2014) describes how digital technologies can provide rapid feedback, allowing learners to self-assess their language production, identify areas for development, and engage in self-directed learning.

Enhanced Language Learning Outcomes

Numerous studies have shown that incorporating IT into English language training can improve students’ language learning outcomes. According to Smith and Johnson (2014), multimedia materials such as interactive movies and online simulations can help students understand and remember English vocabulary and grammar norms. Similarly, Wang and Chen (2016) discovered that computer-assisted language learning (CALL) software

https://journals.e-palli.com/home/index.php/ajet
boosted college students’ writing skills. These findings imply that integrating IT can give learners engaging and interactive language learning experiences, improving their overall English ability.

**Improved Teacher-Student Interactions**
IT integration allows for more individualised and rapid feedback, which improves teacher-student relationships. According to Ahmad et al. (2017), learning management systems and online assessment tools enabled teachers to provide personalised feedback on students’ assignments, resulting in a more robust knowledge of English language topics. Furthermore, interactive whiteboards and multimedia presentations have been shown to improve communication and promote collaborative learning environments (Fernandez, 2011). These technological tools allow teachers to provide customised instruction and support, resulting in more successful teacher-student interactions and language learning experiences.

**Facilitating Language Acquisition**
Integrating IT in teaching English offers various opportunities for authentic language exposure and practice. According to Johnson (2015), online language resources, such as language learning websites and mobile applications, can provide learners ample opportunities to listen to and interact with authentic English materials, facilitating language acquisition and improving listening and speaking skills.

**Promoting Autonomous Learning**
IT integration empowers students to take ownership of their learning process by providing access to various online resources and self-study tools (Chen, 2018). Platforms like virtual learning environments and learning management systems facilitate independent study, allowing students to set their pace and explore language materials based on their needs and preferences.

**Improving Language Proficiency**
Several studies have found that integrating IT into English language education positively affects students’ language proficiency (Brown & Lee, 2017). Interactive language learning software, online writing platforms, and virtual language exchange programs enable students to practice and receive feedback on their language skills, leading to improved writing, grammar, and vocabulary proficiency.

**Challenges of Integrating Information Technology in Teaching English**
**Technological Barriers and Infrastructure**
Despite the potential benefits, incorporating information technology into English instruction poses several obstacles. The availability and dependability of technology resources is a considerable barrier. Inadequate access to computers, internet connectivity concerns, and a lack of technical support, according to Guo and Wang (2012), can all impede the efficient use of technology in language courses. Furthermore, Chen (2017) emphasises the importance of ongoing training and professional development to provide instructors with the skills and knowledge to integrate technology properly.

**Pedagogical Considerations**
Another area for improvement in using information technology in English language instruction is maintaining suitable pedagogical practices. According to Warschauer (2010), aligning technology use with well-designed instructional strategies and objectives is critical. Tutors must use technological tools that complement their teaching methods and provide relevant learning experiences. Furthermore, Hsu et al. (2019) emphasised the importance of task design and technology integration to enhance language development effectively.

**RESULTS**
**Introduction**
This systematic review examines the impact of integrating information technology (IT) in teaching English in education colleges. The review synthesises relevant research studies to determine the effects of IT integration on various aspects of English language teaching and learning. This section presents the key findings of the review and discusses their implications for the field of education.

**Positive Impact on Student Engagement and Motivation**
Several studies found that incorporating IT into English classes boosted student involvement and motivation. Smith et al. (2018) discovered, for example, that adding interactive multimedia technologies in language training encouraged active engagement and piqued student interest. Similarly, Johnson (2020) stated that adopting educational apps and online platforms increased student motivation by fostering a sense of autonomy and personalisation. These findings imply that incorporating IT into the classroom can create a more dynamic and engaging learning environment, influencing students’ willingness to learn English.

**Enhanced Language Skills Development**
The review found that IT integration has a considerably favourable impact on the development of language abilities. Several studies found that students exposed to technology-enhanced language learning methodologies improved their listening, speaking, reading, and writing skills. For example, Chen and Wang (2019) revealed that employing virtual reality simulations for speaking practice increased students’ speech proficiency and encouraged authentic conversation. Furthermore, Li et al. (2021) discovered that computer-assisted reading programs improved students’ reading comprehension abilities. These findings show the potential of information technology integration in fostering more effective language skill development.
Increased Access to Authentic Language Resources

Students now have access to a wide selection of authentic language resources thanks to the incorporation of IT in English language teaching. Through online platforms, digital libraries, and language learning applications, learners can interact with real-life language materials such as news articles, films, and podcasts. Students’ knowledge of contextual usage, vocabulary acquisition, and cultural competency improve because of their exposure to authentic language (Garca-Holgado et al., 2022). These tools’ availability also helps foster a more learner-centred and self-directed learning environment.

Challenges and Limitations

The review noted significant obstacles and limitations despite the various advantages of incorporating IT into English instruction. Much research identified the requirement for proper technical support and infrastructure as a frequent concern. Inadequate access to a dependable internet connection, outdated technology, and a lack of teacher training opportunities hampered the successful integration of IT tools and resources. Concerns have also been expressed concerning the overuse of technology and its potentially harmful impacts on face-to-face interaction (Brown & Lee, 2019). These difficulties highlight the significance of addressing technical and pedagogical support requirements to achieve successful IT integration.

DISCUSSION

The findings of this systematic review indicate that integrating Information Technology in teaching English in College of Education settings holds considerable potential for improving students’ engagement, language skills development, and personalized learning experiences. IT tools’ interactive and multimedia-rich nature can create a dynamic and stimulating learning environment catering to students with different learning styles and preferences. Moreover, IT integration can bridge geographical barriers, offering students access to language learning resources beyond traditional classroom settings. The flexibility of online learning platforms and virtual language laboratories allows students to practice language skills at their own pace and convenience, promoting self-regulated learning and autonomous language acquisition. However, successful IT integration is contingent upon educators’ proficiency in using technology as a pedagogical tool. Teacher professional development programs that focus on building digital literacy and incorporating IT effectively into language instruction are crucial for maximising the positive impact of technology on student outcomes.

Despite the numerous benefits observed, some challenges remain. Technological infrastructure limitations, particularly in resource-constrained environments, can hinder widespread adoption. Additionally, concerns regarding students’ excessive screen time and potential distractions in the virtual learning environment warrant further investigation.

CONCLUSION

In conclusion, this systematic review has shed light on the significant impact of integrating information technology in teaching English in education colleges. The findings from the included studies consistently highlighted the numerous benefits and positive outcomes associated with using technology in English language instruction. Through the systematic analysis of a wide range of research articles, this review has synthesized the current knowledge in the field, providing valuable insights for educators, policymakers, and researchers.

Integrating information technology in teaching English has proven to enhance student engagement, motivation, and participation and foster autonomous learning and critical thinking skills. Interactive multimedia, computer-assisted language learning (CALL) programs, online resources, and digital tools have emerged as effective pedagogical instruments, facilitated language acquisition and promoted communicative competence. Moreover, technology-mediated instruction has demonstrated the potential to accommodate diverse learning styles and preferences, catering to individual student needs and promoting inclusive educational practices.

The systematic review also emphasized the importance of adequate infrastructure and technical support to implement technology-enhanced language teaching successfully. Access to reliable internet connectivity, well-equipped computer labs, and appropriate teacher training are vital factors contributing to the effective integration of information technology in the classroom. Additionally, the review highlighted the need for continuous evaluation and research to identify best practices, address challenges, and explore emerging trends in the field.

While the overall findings of this systematic review indicate a positive impact of integrating information technology in teaching English in colleges of education, it is crucial to acknowledge the limitations within the existing body of literature. Many studies included in this review were conducted in specific contexts and settings, limiting the generalizability of the findings. Furthermore, the rapid evolution of technology and its potential implications for language instruction necessitate ongoing research to stay abreast of new developments and their impact on teaching and learning.
